ABSTRACT

Data from fiscal 1979 provide the basis for an analysis of distribution of Federal dollars among county areas and assessment of major recent trends. Federal per capita funding remains unevenly divided among the regions; however, the advantage of the West and South may be moderating somewhat. The spread of some Federal programs into more rural counties may have helped reduce the nonmetro area funding deficit. Major differences remain in the way specific categories of programs are allocated. Nonmetro areas are behind urban areas in defense funding, but lead in community resources and agricultural programs. Poorer nonmetro counties are especially reliant on income security programs. The report is organized around several major themes: the changing roles of individual Federal agencies; the types of programs providing Federal assistance; the allocation of dollars among regions of the country; the division of funds according to the income level of nonmetro counties; and the distribution of funds among metro and nonmetro areas. Approximately half the document consists of tables and figures. (Author/BRR)

Federal Funds In 1979: Geographic Distribution and Recent Trends, by J. Norman Reid, Charles I. Hendler, and Eleanor Whitehead, Economic Development Division, Economic Research Service, U.S. Department of Agriculture. Washington, D.C. April 1982. ERS Staff Report No. AGES820105.

ABSTRACT

This report summarizes the distribution of Federal dollars in 1979 and assesses recent trends. Federal per capita funding remains unevenly divided among the regions; however, the advantage of the West and South may be moderating somewhat. The spread of some Federal programs into more rural counties may have helped reduce the nonmetro area funding deficit. Major differences remain in the way specific categories of programs are allocated. Nonmetro areas are behind urban areas in defense funding, but lead in community resources and agricultural programs. Poorer nonmetro counties are especially reliant on income security programs.

Keywords: Federal outlays, Federal spending, Federal aid, Federal programs, expenditure analysis, public policy, program analysis, rural development, urban policy.

SUMMARY

This report analyzes the distribution of Federal dollars among county areas during fiscal 1979 and assesses major trends that have occurred in recent years. The report is organized around several major themes: the changing roles of individual Federal agencies; the types of programs providing Federal assistance; the allocation of dollars among regions of the country; the division of funds according to the income level of nonmetro counties; and the distribution of funds among metro and nonmetro areas.

During the last two decades, the Federal budget has grown rapidly, both in total dollars and as a percentage of the Nation's total economic output. Despite its importance, however, the full implications of the budget, and especially its geographic distribution, are not well understood. This results partly from the inadequacy of data on Federal funding. The Federal funds data reported by the Community Services Administration (CSA) are the most complete base of data on the distribution of Federal dollars. However, even these data are not always accurately reported at the county level. As a result, only 87 percent of the Federal funds reported by CSA could be used in this report.

It is easy to draw misleading conclusions from figures on the distribution of Federal funds. Many programs have benefits that accrue to areas broader than those represented in the data. Some programs buy useful services or facilities for a community, while others may only contribute to local payrolls or purchases. Some funds may escape the receiving community without having either sort of benefit.

In 1979 over half of all Federal funds were concentrated in the Department of Health, Education, and Welfare (later reorganized into two departments) and the Defense Department. Most other departments made up under five percent of the total. HEW grew the fastest during the seventies; Defense grew slower than any other cabinet department, due mainly to the ending of the Vietnam War.

Transfer payments make up a third of Federal funds and have increased in importance in recent years. Only loan programs have grown faster. Grants-in-aid and administrative costs have lagged behind as a source of growth in Federal funding.

Regional distribution of Federal funds remains uneven, with the West and South leading the Nation in per capita receipts. These differences among regions are narrowing, but only slightly.

The Nation's nonmetro areas include a disproportionately high number of low income counties, most of which are found

in the South. Except for a few high income counties with very high funding, nonmetro counties received nearly identical average per capita dollar amounts regardless of their income level. The functional makeup of funding varies among income levels; however. The poorest counties rely more on income security and community development programs. Wealthier counties rely more on defense and energy funds.

While nonmetro counties lag behind metro areas in per capita funding, the gap has narrowed slightly in the last few years, especially in the most rural areas. They now exceed the national average in per capita funding.

Several important programs have spread into a wider number of counties, so that some nonmetro counties now have greater access to federally-funded services than before. However, central counties of large metro areas remain the best funded areas.

Nonmetro counties rely more heavily on loans and transfer payments; metro areas obtain more of their funds from contracts (especially defense) and from salaries and administrative expenses. Defense funds are much less important to nonmetro counties than metro areas. Income security programs are somewhat more important in nonmetro areas. Not surprisingly, agricultural and natural resources programs are most significant in the most rural counties, where they greatly outrank defense dollars as a source of funds.

FEDERAL FUNDS IN 1979: GEOGRAPHIC DISTRIBUTION AND RECENT TRENDS

J. Norman Reid, Charles I. Hendler, and Eleanor Whitehead */

INTRODUCTION

One of the most widely discussed issues in recent years is the size, distribution, and impact of the Federal budget. The discussion has spawned a number of studies reporting on the geographic distribution of Federal funds.^{1/} However, most of these have focused only on funding to broad regions and have omitted consideration of smaller areas, such as cities, counties, depressed areas, or urban-rural groupings. Yet it is at the level of such local area groupings that analysis of funding is the most meaningful. To what extent is Federal funding directed toward low income areas, rather than higher income places? In what ways is the package of funds in rural areas different from that going into the Nation's urban counties? And how have these funding patterns shifted in recent years? These are among the questions that this report seeks to address.

The report is organized in six parts. The remainder of the introduction reviews trends in Federal spending and discusses the data used in this report. The second part considers recent changes in the funding levels of the major Federal departments and the third discusses the types of programs that make up the total. In the fourth section we examine the regional distribution of Federal funds and assess shifts that have occurred in recent years. The fifth section analyzes the distribution of funds among nonmetropolitan areas in relation to their income levels. In the final section, we compare the

^{1/} A variety of terms are used to describe the Federal budget and its distribution. Some common ones, such as expenditures and outlays, have precise meanings that are more limited than the subject of this report. Unlike many analyses, this one includes both expenditures and non-expenditure fiscal activity such as loan guarantees. Also, in general the figures represent obligations (commitments) rather than actual budget outlays. To avoid confusion, a general term--Federal funds--is used in this report except where a more specific term is appropriate.

division of Federal funds among metropolitan and nonmetropolitan county groupings.

Growth in Federal Spending

The most salient feature of the Federal budget is its continued growth (figure 1). Since 1960, Federal spending for all functions has risen by 452 percent, from under \$100 billion to more than \$530 billion in fiscal 1979. Much of this increase, of course, can be attributed to the inflation in the economy that has pushed the costs of providing even a constant level of services higher and higher. This can be seen in figure 1, where the curve showing spending in constant dollars rises much more slowly than the curve showing spending in current dollars. Even so, spending in these real terms more than doubled during this period of expansion in the Federal budget.

In relation to the Nation's total economic activity, or Gross National Product (GNP), Federal budget increases have not been radical (figure 2). Nor have they always occurred at a constant pace. Still by 1979, Federal spending made up 22.7 percent of GNP, 3.3 points higher than the level in 1960. This represents a 17 percent increase during the period.

One of the important functions of the Federal government over the years has been to provide support for many services carried out by State and local levels of government. Since 1960 the percentage of State and local budgets financed with Federal grants has risen steadily from less than 12 percent to more than 18 percent (figure 3). The most rapid increases came during the late sixties, when many "Great Society" programs were being implemented, and in the early seventies. The greatest rise was in 1973, the first year of the general revenue sharing program. Except during the height of the Vietnam War in the late sixties, the increase was steady until 1979, when Federal aid declined slightly as a percent of all State and local revenues.

Previous Studies

Despite the continued importance of Federal spending, many aspects of it--in particular, its geographic distribution and local impacts--are not thoroughly understood. There have been relatively few comprehensive reports on the geographic distribution of Federal funds and even fewer that have attempted to measure their effect.^{2/} There are several reasons for this. Not only is the Federal budget large but it is very complex, comprised of thousands of programs that encompass a wide range of specific activities. To comprehend all of these Federal

^{2/} The most comprehensive recent reports are 3, 5, 9, and 10. For an extensive bibliography, see 3, p. 187.

programs is a major task, and to measure the many ways they affect the American economy and public well-being is many times more difficult. The task is made more difficult by the lack of adequate information that identifies and describes Federal programs (7).^{3/}

Basic information on the objectives and operations of individual programs has long been an important need (7) and it continues to be in short supply. Data on the levels of funding for individual programs is more easily obtained, though, as we consider in the next section, what is available has many shortcomings.

Data on Federal Funds

Of the several major sources of Federal funding data, only one provides annual reporting on the geographic distribution of Federal funds that is both comprehensive and highly detailed (for a review of these data sources, see 3, pp. 12-20 and 127-30). That data source--the U.S. Community Services Administration's Geographic Distribution of Federal Funds 4/--is the basis for this report.

The CSA Federal funds data series has several important advantages. First, it is more comprehensive than any other base of data on Federal funding, extending to most executive branch programs and including loans, loans guarantees, and insurance, in addition to the grants-in-aid, transfer payments, contracts, salaries, and other administrative expenditures--programs that are more commonly included in reports on Federal fiscal activity. Second, it is highly detailed, with separate entries for nearly 1,900 program categories in 1979. Third, it is the only source that presents figures on total Federal funding to each of the Nation's counties and its cities over 25,000 population. Finally, it is widely available, being published annually in both printed form and on computer tape.^{5/}

Somewhat offsetting their advantages, the Federal funds data have several important drawbacks. First, much of the data reported for individual counties is based on estimates rather than fiscal accounting; sometimes the estimates use methods that are too inaccurate to permit use of the data.

^{3/} Underscored numbers refer to items in the Literature Cited section at the end of this report.

^{4/} These reports were formerly known as the Federal Outlays reports.

^{5/} The annual reports may be purchased from the National Technical Information Service. The computer tapes may be purchased from the Machine Readable Tapes Division of the National Archives and Records Service.

Second, some funds--though credited to the proper "recipient" locality--have little or no impact on the place to which they are reported, thus overstating the Federal Government's effect on that area. And in still other cases--mainly formula grants to States--the flow of funds has not been traced beyond each State's capital city to the cities and counties that are the ultimate beneficiaries.

Data Used in this Report

Because of these shortcomings, analyses must be limited to those programs judged to be reliably reported. Thus, except where noted, this report is based on the 87 percent of Federal funds contained in the Community Services Administration's reports that are judged to be reliable for county-level analysis.

The programs judged reliable are categorized in table 1 by the function they support. In general, the most usable figures are for community and economic development programs; 99 percent of total funds for that function are included in this report. For most other functions, over 80 percent of total dollars could be used in this report. Only for two categories of programs--"education and social services" and "other" functions--were less than 75 percent of funds reported.

Programs are omitted from the report for several reasons. Some 4.2 percent of the funds involving formula grants to States are reported to the State capital city and are not traced to their ultimate beneficiaries. Another 5.7 percent are estimated using methods judged not reliable enough for analysis. The remainder are funds mainly spent overseas, though reported to a U.S. city (1.9 percent), or that otherwise improperly report the location of fund recipients (1.5 percent). Farm export financing programs are included in the latter group.

The report includes Defense Department contracts, though their reporting basis has been much criticized (3, p. 20). As reported to the Community Services Administration, they are traced only to the location of the prime contractor. However, defense contracts are often complex, and any single contract may involve a number of subcontractors, each of which supplies some portion of the finished product. As a result, by the time the funds are actually spent for salaries and materials, they may be allocated quite differently from the way prime contracts are distributed. Despite this, defense contracts are included in this report because they are such an important part of the total budget. The reader should keep this limitation in mind.

Interpretation of Federal Funds Data

Some caution should be observed in interpreting data on the geographic distribution of Federal funds. Though one is drawn to the conclusion that areas with the highest total funds receive the most benefits, there are several reasons why this may not always be true.

Areas Served

The benefits from Federal programs are not always limited to the communities where the funds are spent (and where they are reported). Flood control projects constructed in upstream counties have obvious benefits for downstream counties as well, even though no funds may be spent in them. Defense purchases made in manufacturing centers benefit the entire Nation.

In other cases, benefits are more localized. The construction of housing or health clinics, for instance, mainly benefits the community where the funds are spent or loans made.

The Federal funds data themselves indicate only the area in which the dollars are spent or loaned. How general or how localized program benefits may be is impossible to determine without careful examination of individual programs.

Income and Employment Effects

Not only do Federal funds buy a service or public good (such as energy research, a highway, or physical therapy) but they may also contribute to the level of economic activity in the area that receives the funds. Federal funds are used to pay salaries, purchase equipment, and construct facilities, often raising local incomes and leading to higher employment levels. These funds may be respent within the same community, thus having a multiplier effect within the area.

Like program benefits, however, these secondary economic benefits are not always localized. While some programs may pay local salaries or increase local incomes by purchasing locally-produced goods, others are used to hire workers from outside the community (typical on many construction jobs) or to buy products made elsewhere, even in another State. To the extent that Federal funds are spent outside the community, the income and employment benefits from the funds will spill over local boundaries into other areas. Since this is more likely to happen for some programs (purchases of manufactured goods, construction) than for others (salaries or retirement benefits), one cannot assume that each area's economic benefits are proportional to its share of funds, especially since the mix of Federal programs varies significantly from place to place (8).

Loans and Grants

Federal funds are transferred to local areas by several methods. A major distinction can be made between spending and loans. Spending includes transfers such as contracts, grants-in-aid, salaries of Federal employees, retirement

and welfare payments, and various purchases. Expenditures usually need not be returned to the Federal Treasury. Loans, on the other hand, must be repaid (federally-guaranteed loans are repaid to private lenders). Because of this, the value of a loan to a community may be much less than that of an equivalent expenditure for the same purpose (8).

Loans also vary in value, since they differ in both repayment period and amount of interest subsidy. Thus, areas that receive the same gross amount of loans may derive different levels of benefits. A forty-year loan is worth more to a community than a fifteen-year loan. Likewise, a 5-percent interest rate carries a higher subsidy than a 10-percent loan.

These distinctions are important since there is considerable variation from place to place in the ratio of spending to loans. Nonmetropolitan areas generally receive a larger percentage of their funding from loans (including both direct loans and loan guarantees), thus overstating somewhat the level of benefits these areas receive from the Federal funding process (figure 4). There are also some important differences among the Nation's regions (figure 5). Since the data reported here give only the face value of loans and not their true value to the receiving community, comparisons of the benefits among individual areas are difficult.

FEDERAL AGENCY ROLES

The total of Federal funds distributed by individual Federal departments are one indication of their relative importance in the public economy. Such a comparison is made in table 2, which reports funding by major department or agency for fiscal years 1970, 1975, and 1979. Because the figures include property transfers, loans, and loan guarantees, they give a more complete picture of each department's fiscal activity than is provided by looking at expenditures alone.

In fiscal 1979, as indeed throughout the seventies, Federal funding was concentrated in two departments--Health, Education and Welfare (HEW) ^{6/} and Defense--which together accounted for over half of the total. HEW accounted for the largest share--\$182 billion, or nearly a third of all Federal funds. Defense was the only other department with more than \$100 billion in funds and made up just under 20 percent of the total.

^{6/} The Department of Health, Education, and Welfare has since been divided into the Department of Education and the Department of Health and Human Services.

-- Not applicable or none.

1/ Some Energy Department functions were transferred from other departments.

2/ The Department of Health, Education, and Welfare was subsequently divided into the Department of Education and the Department of Health and Human Services.

3/ Figures for the Department of Housing and Urban Development may be understated somewhat due to the omission of some of its programs from the Federal funds reports for some years.

Source: U.S. Community Services Administration, Federal Outlays reports for fiscal 1970, 1975; Geographic Distribution of Federal Funds report for fiscal 1979.

Only four other agencies accounted for as much as 5 percent of total Federal funds. Of these, the Agriculture Department had the highest total (8.4 percent), followed by the Treasury Department (7.0 percent), Veterans Administration (6.7 percent), and the Department of Housing and Urban Development (5.0 percent). The remaining agencies accounted for 21.5 percent of the total, or only slightly more than the Defense Department's funding.

The concentration of federally-funded activities in a few major departments continues the pattern that was evident throughout the seventies. In both 1970 and 1975, HEW and Defense distributed over half of all Federal funds, with most of the remaining funds in the hands of very few agencies.

However, there were some important shifts in the relative size of agency activities during the seventies. The major change was the emergence of HEW as the largest funder and the slowed growth of Defense Department funding as the Vietnam War drew to a close. HEW funding grew almost two and a half times during the period, while the Defense Department's budget increased 89 percent, less than any other cabinet department.

Among the cabinet departments, the Labor Department grew the fastest (531 percent), followed by Commerce (331 percent), HEW (246 percent), and Agriculture (239 percent). These changes made Agriculture the third largest funding agency. Labor and Commerce, however, started with small funding totals and even these rapid increases did not place them among the larger agencies.

The five largest agencies had the largest dollar increases and accounted for nearly three-fourths of the growth in funding. HEW's funding rose \$129 billion during the seventies, or more than the total funding for any other department in 1979. Funding for the Defense Department increased \$51 billion, followed by Agriculture (\$34 billion), the Veterans Administration (\$24 billion), and the Treasury Department (\$23 billion).

The increases in funding also brought new roles for many Federal agencies. While these changes are too numerous to describe in detail here, the altered mission of the Department of Agriculture illustrates the point. Traditionally, USDA's programs have concentrated on farmer assistance and related support programs, and in 1970 nearly three-fourths of USDA's budget went for these programs (figure 6). During the seventies, however, USDA assumed new responsibilities in the areas of community and economic development and food and nutrition. Total funding for these programs increased almost seven and a half times between 1970 and 1979; by 1979 they accounted for 53

Fig. 6--USDA Funding by Function, 1970 and 1979

Agricultural Programs

1970

1979

percent of USDA's funding. Though farm-oriented programs grew by 83 percent during this period, they declined in relation to other USDA programs and accounted for only 38 percent of the Department's budget in 1979.

TYPES OF FEDERAL FUNDS

Federal funds include several major program types. The usual image of Federal funding, of course, is spending to cover the salaries of public officials and the costs of administering Federal Government responsibilities. In fact, however, these salaries and administrative expenses made up only 18 percent of all Federal funds in fiscal 1979 (table 3). A much larger share of funds (33 percent) went for transfer payments to the retired or poor and to farmers and businesses. Contracts, mainly for Defense Department purchases, and grants to States, local governments, universities, and private groups each accounted for about a sixth of total funds.

Not all Federal funds are actually expenditures. Loans made directly by the Federal Government and Federal guarantees of loans by private lenders comprise a slightly smaller share of funds than grants-in-aid (14 percent). The remaining Federal funds, made up largely of insurance payments and the value of donated property, amount to less than one percent of the total.

In broad outline, the division of Federal funds among types of programs changed relatively little between 1978 and 1979. As a percentage of all Federal funds, no program type changed in order of importance and none gained or lost more than 1.6 percentage points.

However, this apparent stability masks some rather fundamental recent shifts in Federal fiscal activity. New issues of direct and guaranteed loans have undergone drastic increases in recent years. Between 1978 and 1979, they grew by more than 25 percent and though they still make up under 15 percent of all Federal funds, they are presently the fastest growing program type. The popularity of these measures, due in part to their being handled outside the normal budgetary process, has grown throughout the seventies. Between 1975 and 1978, guaranteed loans increased 98 percent, while direct loans grew by over 478 percent (3, p. 239).

Transfer payments accounted for the largest increase (\$17.9 billion) and the second highest rate of growth (12.5 percent) between 1978 and 1979. These programs too are somewhat exempt from normal budgetary controls, and this may account for some of their growth. Most transfer payments are made under entitlement programs such as social security or medicare; they are considered to be largely uncontrollable parts of the

budget, since total expenditures are determined by the number of qualified applicants who make claims during any year and not by budget decisions at the start of that year. Between 1975 and 1978 total transfer payments rose by over 68 percent (3, p. 237).

The rate of increase in other program categories has been much slower. Both grants and Federal salaries and expenses increased less than six percent between 1978 and 1979, less than enough to keep pace with inflation. For grants this is a marked change from earlier trends; grants-in-aid were a major growth item during most of the seventies, rising by 38 percent between 1975 and 1978 (3, p. 237). Contracts, mainly for defense purchases, grew by 9.7 percent between 1978 and 1979, or slightly less than the overall rate of increase for Federal funds.

REGIONAL DISTRIBUTION OF FUNDS

Federal funds are distributed rather unevenly among the Nation's regions (table 4). By far the largest amount of 1979 funds (\$172 billion) went to the South. The West (\$107 billion) and the North Central region (\$106 billion) received nearly identical amounts. The Northeast received the least (\$99 billion).

Table 4—Federal funds by Census region, fiscal 1979*

Region	Federal funds		1978 population
	Total	Per capita	
	Bil. Dol.	Dollars	Millions
Northeast	98.8	2,012	49.1
North Central	105.6	1,811	58.3
South	171.8	2,434	70.6
West	106.6	2,658	40.1

Clearly some of these differences among regions result from the intended purposes of the Federal programs. For one thing, the populations of the regions differ considerably. While not all Federal funds ought to be allocated evenly according to population, comparisons of the per-capita distribution of funds is one method, commonly used, of assessing equity in the distribution of dollars.

The West receives the largest share of dollars per capita (\$2,658) since its funds are distributed among fewer people than the other regions. The South, with both the most dollars and the most residents, is next (\$2,434). The Northeast has the fewest dollars but also a relatively small population; it has the third highest per-capita total (\$2,012). The North Central States have 19 percent more population than the Northeast, but only 7 percent more funds, leaving them last (\$1,811).

Recent Changes

These regional differences have persisted over time. The positions of the regions are illustrated in figure 7, which shows the percentage by which each region's per-capita total differs from the national average. Between 1976 and 1979 there was some slight moderation in the differences, and all regions except the South moved closer to the national per-capita average.^{7/} However, except in the West these movements were slight and it is not clear that they signal any fundamental shift in the allocation of Federal funds.

Differences By Function

The division of total Federal funds among functions is by no means uniform across the regions (table 5). The largest function is national resources, comprised mainly of defense and space programs. These programs provide more funds in the West and South than any other category and account for around forty percent of the total in both regions. In the Northeastern and North Central regions, however, income security programs are the largest source of funds, mainly due to the large amounts of support payments in the Northeast and the low levels of defense, space, and energy funding in the North Central region.

In all regions, community resources programs--including business development, community development, housing, and public infrastructure programs--ranked as the third most important source of Federal funding; they accounted for about a fifth of all funds nationally. Housing programs make up the largest portion of this category and are the main reason why per-capita community resources funding is so high in the West. The South also ranks high in community resources funds due to high funding levels for business and community development and transportation.

Agricultural and natural resources programs total less than five percent of all funds nationally. They are especially important in the North Central region, where--due to large

^{7/} This finding parallels similar trends reported by ACIR for the 1969-1976 period. See 1, p. 60.

Note: Detail may not add to totals due to rounding.

amounts of payments to farmers--they make up 7 percent of the total. However, larger outlays for land management and natural resources leave per-capita levels of funding highest in the West. This function makes up only a very small part of the funds going to the Northeastern region, which has neither extensive Federal land holdings as the West, nor a major agricultural economy as in the North Central or Southern regions.

What we call human resource programs--education, health, and employment programs--account for the smallest portion of Federal dollars. More of these funds per capita go to the West than to any other region; the least go to the North Central States.

Differences in Program Types

The regions differ greatly in the kinds of programs that are important to them (figure 5). While transfer payments are the most widely used program type nationally, they are much more important to the Northeast and North Central regions--where they make up over 40 percent of all funds--than in the South and West, where they account for 30 and 26 percent respectively. Federal employee salaries, on the other hand, are more significant to Southern and Western States, and they make up almost twice as large a percentage as in the "frostbelt" States. Contracts--mainly for defense purchases--are a very important part of Federal funding in the West; they are much less critical, though still significant, to the other regions.

Taken together, grants and loans make up what may be called Federal "assistance." Grants are mainly made to State and local governments, while loans and loan guarantees include--in addition to governments--credit for farmers, home purchasers, and businesses. This assistance made up a third of Federal funds in the North Central region, more than in any other region. The West was second (31.5 percent), followed by the South (30 percent). The Northeast relied on these Federal assistance programs the least (27.9).

The distinction between grants and loans is an important one, since loans must be repaid by the recipient, while grants are not. The Northeast derives only a small part of its funds (6.6 percent) from loan programs, while the other regions rely on loans for around 16 or 17 percent. By contrast, grants are much more important in the Northeast, making up 21 percent of Federal funds. The North Central States obtain 17 percent of their Federal funds from grants, while the South and West each get about 14 percent from this source.

Perhaps surprisingly, the Northeast ranks highest in per-capita grants (\$428), followed by the West (\$375) and the South (\$345); the North Central States obtain the smallest per-capita

amount from grants (\$312). 8/ This finding contradicts the widely held belief that the Northeast has been overlooked in distributing Federal grants, but it is consistent with other recent studies (1, pp. 88-89; 8, p. 99).

It can be argued that the economic stimulus value of expenditure programs (such as grants, contracts, and salary expenditures) is higher than for a corresponding level of loans or loan guarantees, if only because the community that receives the loan must eventually pay it back (8). If this is true, then overall figures on Federal funding probably understate the relative amount of stimulus the Northeast receives from the Federal budget since that region derives such a small percentage of its funds from loan programs.

FEDERAL FUNDS TO LOW-INCOME AREAS

There are a number of reasons to expect Federal funding to treat low-income areas differently from higher-income areas. For a number of years, Federal policy has included a range of grant and loan programs to induce economic and community development in the Nation's most depressed counties. These programs have supported a variety of activities, including business assistance, development planning, and job creation through public works projects.

At the same time, one expects to find higher concentrations of social welfare expenditures in depressed counties, since they tend to experience higher concentrations of poor and dependent residents. Funding for such programs as social security, public assistance, job training, and health care is expected to be higher in low-income areas than in places with higher average resident incomes. Overall, higher spending totals might be likely in the poorer areas as well.

What, in fact, is the record of Federal funding to the Nation's poorer areas? In this section we review the record of funding to nonmetropolitan counties to see how funding varies among areas with differing levels of income.

The analysis in this section concentrates on the Nation's 2,510 counties (or equivalent areas) that lie outside the boundaries of Standard Metropolitan Statistical Areas (SMSA's). Income differences are measured by average per capita income; in order to avoid errors caused by annual fluctuations in farm

8/ These include grants to State and local governments, universities, and non-profit groups. It must be remembered that these figures omit 55 programs, mainly formula grants to State governments, totalling \$23.6 billion that have been excluded from the study for reasons discussed earlier.

prices, an average for 1977 and 1978 was used.^{9/} The income categories are shown in table 6.

Table 6—Distribution of nonmetropolitan counties by region and income level

These income categories reflect both a county's current income position and, to an important degree, its historical circumstances as well. The categories are closely related with the "persistent low income" designations reported by Davis (4). Davis identified 255 nonmetro counties whose per capita incomes consistently placed them in the bottom 20 percent of nonmetro counties during the 1950-1975 period. Each of these counties had a 1977-78 income level under \$6,000 per-capita, and over two-thirds averaged less than \$4,500. At the same time, nearly 60 percent of counties with less than \$4,500 per-capita income were designated "persistent low income," meaning that their position has changed little over the preceding quarter century. By contrast, less than 8 percent of the counties with incomes of from \$4,500 to \$6,000 experienced persistently low average incomes.

Distribution of Low-Income Counties

Most low-income counties are located in the South, which has 79 percent of the poorest counties and 55 percent of those in the \$4,500-\$6,000 category (table 6). In part this is because the South has more counties than any other region. But the South also has the greatest concentration of low income

^{9/} Residence-adjusted personal income, as reported by the Bureau of Economic Analysis, U.S. Department of Commerce.

residents and areas. Most of these are found east of the Mississippi River. The largest number of higher income counties is found in the North Central region, which also has the second largest number of very poor counties. The concentration of extremely high income counties in the West--mainly the Pacific States--is due in part to the high cost of living and inflated incomes common in Alaska.

The distribution of counties and population by metropolitan status is shown in table 7. Being adjacent to an SMSA does not seem to relate to county income, but degree of urbanization does. The more urbanized nonmetro counties (with 20,000 or more "urban" residents in 1970) are far more likely to average \$6,000 or more per capita in income than the less urbanized nonmetro counties (with 2,500 to 20,000 urban residents). These in turn have higher average incomes than the totally rural counties, over 60 percent of which fall into the lowest two income groups.

Differences Among Income Levels

With the exception of the highest income category, per capita levels of Federal funding are remarkably even across the income categories (table 8). Those counties with average incomes over

Table 8--Per capita Federal funds by income level,
nonmetro areas, fiscal 1979

\$6000-7499	1,967
\$7500-8999	1,999
9000 & above	4,873
Total	1,994

\$9,000 received very high levels of funding for energy, space, defense, community resources, and agricultural assistance. They averaged more than twice the per capita level of funding of any other group of counties. These high income counties, few in number, are clearly unusual cases.

Even more interesting is the fact that the other nonmetro county groups received nearly equal per capita funding. In no case did the overall totals for these groups differ by more than \$40, or 2 percent of the total.

Despite this equivalence in overall totals, the composition of Federal funding differs rather significantly across the county groups (figure 8, table 9). The chief distinction is between the very poorest and the very richest counties, though the great majority of the nonmetro counties that lie between these extremes are also distinct in some respects. Perhaps not surprisingly, counties with 1977-78 incomes less than \$4,500 per capita get almost 43 percent of their Federal dollars from income security programs. More than half of these dollars come from retirement and disability programs that are not particularly associated with serving low income populations. What makes these poor counties unique, however, is a much heavier than average reliance on public assistance and unemployment programs and, to a lesser degree, medical and hospitalization benefits. The higher income counties, on the other hand, rely less on income security programs, and especially public aid and unemployment programs.

The national resources programs, which include mainly defense and space programs (but also programs for veterans, energy research, higher education and research, and general government administration), are most important for the highest income nonmetro counties, where they account for 41 percent of Federal funds. They are correspondingly less important for the poorest counties. Wealthy counties rely to an exceptional degree on energy and space funding and, to a lesser extent, on defense contracts. The lowest-income counties get little funding from any of the sources except veterans programs. Counties in the \$4,500-\$7,500 range are near the nonmetro average for these programs.

Community resources programs are more significant components of the funding picture for both the lowest and highest income counties than for those in the middle categories. However, the mix of programs differs between them. High income counties rely more on transportation, housing, and business assistance programs, while low income counties rely on more developmental programs and those designed to build public facilities. This is not surprising since many of the latter programs were targeted to poorer areas. Both rich and poor counties rely much more than average on programs for American Indians.

Agricultural and natural resource programs make up a relatively small share of funding for all of the income groups. As a percent of all funds they are most significant to the lowest income nonmetro counties and least important to the majority of counties in the middle categories. Agricultural assistance and water and recreational programs account for most of this. Among the wealthiest counties, forest and land management programs also rank high.

METRO-NONMETRO
DISTRIBUTION OF
FUNDS

Human resource programs (other than income security programs categorized separately) make up the smallest part of Federal funding for all income groups but are more significant for the richest and poorest groups. Training and employment programs are a larger part of the total for the three higher income categories, groups, and poorer counties rely on these programs much less than average. Education and social services programs are most important in the low income counties, followed by those with the highest incomes.

On the average, metropolitan counties receive more Federal funds per capita than do nonmetropolitan counties (table 10). Metropolitan counties received an average of \$2,300 per capita, while nonmetro counties averaged \$1,994, ten percent less than the U.S. average.

Table 10--Federal funds per capita, by metropolitan status, fiscal years 1976, 1978, 1979

^{1/} The county classification system is explained in 6.

There are significant variations within the broad metro-metro-nonmetro categories, however. Only two groups of counties exceed the national average by more than a few dollars: the central counties of the largest SMSA's (nearly 20 percent above the U.S. average) and totally rural counties not adjacent to a metropolitan area (12 percent above the U.S. average). All other groups of counties are at or below the national average.

On the whole, metro counties receive more uniformly high levels of Federal funding than nonmetro counties. Only fringe counties of the largest SMSA's, which received 82 percent of the U.S. average, fall significantly below that average. By contrast, only one category of nonmetro counties (totally rural, not adjacent to an SMSA) exceeded the U.S. per capita average, while another (urbanized, not adjacent) was at the average; two of the six groups of nonmetro counties were 14 percent or more below the national per capita level.

Trends in Metro-Nonmetro Funding

There is some evidence that the funding advantage has shifted slightly away from metro areas during recent years (table 10). Between 1976 and 1979, metro areas declined two percentage points relative to the U.S. per capita average, while nonmetro counties gained four points overall. Totally rural counties appear to be the biggest gainers, though less urbanized counties also showed gains. The chief losers were the largest nonmetro counties and the smallest SMSA's.

It would be wrong to overemphasize this observation in light of the short time period studied and the evidence of a more modest shift favoring metro areas between 1978 and 1979. Furthermore, differences in the range of programs included for 1976 as compared with 1978 and 1979 may also partly explain the apparent trend. Nonetheless, the shift is large enough to merit continued watching.

Information from another source supports the conclusion that greater shares of Federal funds are being directed to rural areas. Anton and his associates studied Federal programs in 1975 and 1978 and found that several Federal departments greatly increased the number of counties they aided during the period (3, p. 61).

The major growth was made by the Department of Housing and Urban Development (HUD), which increased the number of counties it funded from 2,768 in 1975 to 3,025 in 1978, and by the Small Business Administration (SBA), which increased its range of operations from 2,473 to 2,799 counties. Among individual programs experiencing major expansion in territory served

are the HUD Section 8 housing assistance program (269 to 2,070 counties), USDA emergency disaster loans (1,132 to 2,111), SBA physical disaster loans (778 to 1,662), and school aid to federally affected areas (942 to 1,537). Anton concludes that rural areas have been the major beneficiaries of this "spreading effect" (3, pp. 70-71).

There are two primary implications of these trends. First, the increased spread of Federal funding activity into smaller rural counties seems likely to yield more equitable treatment than these counties have previously enjoyed. In fact, these figures may understate the advantage to rural counties since they largely exclude Federal dollars paid to State agencies, which are subsequently "passed-through" to local recipients. Rural areas tend to rely more heavily than urban areas on these pass-through dollars.

Second, the spread of activity into a larger number of counties reflects the development of broader clientele by some Federal agencies. Certain agencies--among them the Departments of Agriculture, Health, Education, and Welfare ^{10/}, Labor, Transportation, and the Veterans Administration--serve nearly all U.S. counties to some extent. Others have traditionally focused their operations on a more select set of areas. The expansion of HUD and SBA into more areas suggests that the political and governmental processes associated with serving these areas may now include a larger number of institutions, a shift that may have far-reaching implications for the range of services available to residents of these areas.

Distribution Among Program Types

There are some important differences in the mixture of program types used to fund metro and nonmetro counties (table 11). Transfer payments, the leading type of program, account for nearly 40 percent of nonmetro funds but only about 31 percent in metro areas. In percentage terms, loans and loan guarantees are nearly twice as important in nonmetro as in metro areas. In metro areas, contracts (especially for defense projects) are more than twice as frequent; salaries and expenses also comprise a larger share of metro funding totals. Grants are only slightly more important to metro areas.

There is much variation among the detailed metro and nonmetro categories as well. In particular, loans are much more common in the more rural county areas, where they comprise one-fourth to one-third of all Federal funds. In none of the metro categories, by contrast, do loans amount to as much as 15

^{10/} Subsequently divided into the Department of Education and the Department of Health and Human Services.

Note: Figures may not total 100 percent due to rounding.

percent. The difference is significant. Since loans and loan guarantees--unlike the other methods of funding--must be repaid, including them in overall funding totals overstates the amount of permanent transfers of Federal dollars to an area. As these figures reveal, this overstatement is greatest for the most rural counties and is least for the most urban ones.

Transfer payments comprise a fairly even percentage of funds to metro counties; there is greater fluctuation among nonmetro county groups, but the variations do not seem to adhere to any regular pattern. Grant payments are the most significant to core counties of large SMSA's. Except for the fringes of these same areas, grants make up a fairly even percent of funding across the other county groups, declining slightly among the more rural counties. Salaries tend to be more significant to the smaller SMSA's and the more urbanized nonmetro counties. They are considerably less important to the more rural counties, where Federal administrative offices are less likely to be located. Contracts too tend to decline in importance in the more rural nonmetro counties; they are most important in the largest SMSA's.

A few minor shifts have occurred since 1978 in the types of programs used to aid metro and nonmetro areas (the 1978 figures are reported in 5, p. 3). In both metro and nonmetro areas, transfer payments and loans grew slightly as a percent of total, while salaries and contracts declined slightly in importance. Only grants, which grew in importance in nonmetro areas and declined in metro areas, moved in opposite directions. Whether this shift in grants signals a redirection of assistance efforts toward rural areas, and if so, whether it will be maintained, is impossible to assess from these data.

Distribution Among Functions

There are significant metro-nonmetro differences in the functions served by the funding. Per capita funding levels are shown for five broad functions and 24 smaller functional categories in table 12. Table 13 at the end of this report shows the metro-nonmetro distribution of funds for individual programs making up each category.

Agriculture and Natural Resources

Federal funding for agricultural and natural resource programs totalled \$102 per capita in fiscal 1979, making it the fourth largest function. About two-thirds of the funding for this function consists of agricultural assistance payments; the remainder is largely comprised of resource management and recreational programs, with a smaller share devoted to research.

As might be expected, per capita funding levels are generally much higher in nonmetro counties than in metro areas. The

^{1/} The county classification system is explained in Fred K. Hines, David L. Brown, and John Zimmer, Social and Economic Characteristics of the Population in Metro and Nonmetro Counties, 1970. AER-272. U.S. Dept. Agr., Econ. Res. Serv., Mar. 1975.

Note: Detail may not agree with totals due to rounding.

exception is research, which is divided evenly on a per capita basis between metro and nonmetro areas. Funding levels for the remaining categories are especially heavy in the more rural counties and in those counties not adjacent to a metro area.

In relation to other program categories, the agricultural and natural resource programs are especially important to nonmetro counties, where they comprise 13 percent of all Federal funds (figure 9). By contrast, these programs make up under two percent of metro area funding. Among metro counties, these programs are most important in the smaller SMSA's. In nonmetro areas, agricultural programs are most important in the more rural counties and in those not contiguous to an SMSA. Totally rural counties not adjacent to SMSA's derive fully one-fourth of their funds from these programs.

Community Resources

Programs supporting community, business, and regional development make up the third largest function, with just under 20 percent of all Federal funds. Comparing per capita totals, community resources programs are nearly equal between metro and nonmetro areas. More important differences exist between individual metropolitan status groupings, however. Among nonmetro counties, community resources programs are most important in the totally rural counties where they greatly exceed the U.S. per capita average and make up more than a quarter of all Federal funds these counties receive. These programs decline in importance among more urbanized nonmetro counties and those located close to an SMSA. Among metro counties per capita funding is more nearly equal; it is highest for the core counties of the largest SMSA's and for medium-sized metro areas. Fringe counties of large SMSA's receive the lowest level of any group metro area county group.

Housing programs, mainly operated by the Departments of Agriculture, Housing and Urban Development, and the Veterans Administration, are the largest component of this function nationally. Housing programs are more important in metro areas, where they make up just under 10 percent of all Federal funds; housing funds account for 6.4 percent of the nonmetro total and on a per capita basis they make up less than three-fifths as much as in SMSA's.

These figures may somewhat understate the level of housing aid going to nonmetro residents. Data on housing loans can be traced to the county of the financial institution handling the loan. Many times, however, the lender is located in a different county than the borrower. For example, in less urbanized areas, home buyers may seek loans in nearby urban counties. Where this occurs, loans that benefit rural residents will be credited to urban counties. The size of this bias is not known.

Fig. 9--Relative Importance of Federal Funds by Function and Metro Status, Fiscal 1979

Percent

Programs supporting community facilities are also significant in nonmetro areas, where they equal funding for housing. These programs are most significant in totally rural counties. Business assistance programs also operate at higher levels in nonmetro areas. They are largely offset, however, by transportation programs, which provide almost twice as much funding per resident in metro areas.

Human Resources

As defined for this study, human resource programs include Federal support for education, social services, health, job training, and employment. The category excludes income security programs such as public aid, social security, disability, unemployment compensation, and medical assistance; these are classified separately. It also excludes a number of formula grants to States, including the Title XX Social Services Program, the funds for which could not be traced to individual county areas (see table 1, above, and the accompanying text for more information).

Human resource programs make up the smallest of the five functions, totalling \$85 per capita or just under four percent of all Federal funds. They are considerably more important in metro counties, where they average \$98 per capita, compared with \$53 in nonmetro areas. Human resource programs tend to be more important in the more urban of the nonmetro counties and in the central counties of major metro areas.

Training and employment programs make up over half the national total for this function. These funds are highly concentrated in metro areas, and in nonmetro counties they are less significant than education and social service programs. Health services programs are also more highly concentrated in metro counties.

Income Security

Programs providing various forms of income security are the second largest function nationally, totalling \$785 per capita or more than a third of all Federal funds. However, these programs are even more significant for nonmetro areas, where they average more than \$800 per capita and account for four of every ten Federal dollars. On a per capita basis, the most income security dollars go to central counties of large SMSA's. The next largest shares go to the less urbanized and totally rural counties, especially those not adjacent to a metropolitan area.

Retirement and disability programs make up nearly two-thirds of funds for this function. These programs are somewhat more concentrated in nonmetro areas where they make up a quarter of all Federal dollars. Fringe counties of large metro areas receive the least from these programs on a per capita basis.

Medical and hospital benefits are also slightly weighted to nonmetro areas. While the largest per capita amounts go to core counties of large metro areas, all other metro categories receive far less than the national average of \$188. The most urbanized nonmetro counties are also below the national average. The most rural nonmetro categories are all funded at a little over \$200 per capita.

Public assistance programs make up the smallest part of this function, averaging \$99 per capita and comprising under five percent of all Federal funds. Central counties of large SMSA's receive by far the most per capita from this function (\$147). Nonmetro areas overall average less than metro areas, though funding in the more rural counties averages more than in the smaller SMSA's. The suburban fringes receive the fewest public assistance dollars.

National Resources

The national resources category is comprised of various programs--principally defense, energy, space, and administrative programs--that tend to have national, rather than localized, program benefits. This is the largest function, totalling slightly more than funding for income security. It is far more significant in metro areas, however, and in nonmetro counties it ranks behind income security programs, which are nearly twice as important to these counties. National resources programs make up only about 23 percent of all nonmetro funds, compared with 40 percent for income security programs.

National resources funding varies widely across individual metro status categories. The less urbanized and totally rural nonmetro counties average well under half of the U.S. average and far below the most urbanized nonmetro counties, which are more nearly like metro counties with respect to funding. The low per capita levels in the more rural nonmetro counties result mainly from the low levels of defense outlays in these areas, but all national resources programs contribute.

On the other hand, the highest per capita levels are found in the largest SMSA's--mainly in their core counties--where funding is 25 percent above the national average. Defense contracts account for most of this advantage, though these counties are above the average in most other programs as well. The exception is defense administration, which appears to be more concentrated in smaller SMSA's and in the more urbanized nonmetro counties.

These differences have significant implications for the makeup of Federal funding to each area. At one extreme, the largest SMSA's derive over 43 percent of their Federal dollars from national resources programs; smaller SMSA's are not far

behind. Among the detailed functions, defense contracts make up 14 of all metro area funds and are the second largest source of funds in these areas. Retirement and disability programs account for 21 percent of metro area funds.

The picture in nonmetro counties--and especially the most rural ones--is quite different. Not only do income security programs greatly exceed national resources programs, but the latter are barely more important than community resources programs. Defense contracts make up 4.1 percent of the nonmetro total; many other functions are far more important to nonmetro counties.

At the extreme, totally rural counties not adjacent to an SMSA rely very slightly on these national resources programs, which make up only 11 percent of their funds. More than twice as much of their funding comes from agricultural programs, even though these make up but a small part of the national funding picture. In totally rural counties, per capita agricultural assistance payments are more than 9 times as high as defense contracts.

These figures on the distribution of defense contracts may overstate the metro area advantage. The Defense Department reports its contracts to the location of the prime contractor for each contract. Most of these are subcontracted to smaller suppliers who may be located in different counties. The eventual distribution of subcontracts is not known, but it is likely that small firms in nonmetro areas receive a larger share than is reflected by the figures on prime contracts.

CONCLUSION

This report has surveyed the pattern of Federal funding to local areas during fiscal 1979. In doing so it has touched on a number of facets of the Federal funding process, the growth in Federal funding levels, changes in the financial mechanisms that have been used, the allocation of funds among regions of the country, and variations in funding patterns to counties with differing income levels and metropolitan status. The principal story of the report is that large variations lie beneath overall national funding totals and that these have potentially great importance for individual local areas.

Little attempt has been made here to explain these differences--why they occur as they do--nor to spell out their full meaning for localities. Even if adequate space and time were available, knowledge about the effects of Federal funding is not sufficiently precise to produce the needed answers to many questions. These will have to await future studies. It is hoped that this report will serve as a baseline and that it has raised questions in a way that will generate interest in their resolution.

The report should be useful as a benchmark in another way. Recent budget actions signal the probability of major, long-term shifts in the shape of Federal funding. Future analyses will trace the path of these shifts. This report will serve as a base against which to measure these new directions.
